

**Syllabus for the course
“Mathematical Statistics”**

Area of Specialisation: 01.06.01 Mathematics and Mechanics

Doctoral program in Mathematics and Mechanics

Approved by the Academic Council of the Doctoral School in Mathematics
on 16th October, 2018

Moscow - 2018

This program cannot be used by other departments and other universities without the author's permission

Syllabus

1. Course Description

- a. Title of a Course: Mathematical Statistics
- b. Pre-requisites: the most basic part of probability theory, like distributions of random variables, mathematical expectations and variances for random variables, statement of the central limit theory (knowledge of the proof is not required).
- c. Course Type: optional
- d. Abstract: The main goal of mathematical statistics is an adaptation of the theoretical probabilistic models to some practical problems in economics, physics, medicine, social sciences. Typically the precise distribution or random process that describes some phenomenon is not known; however, some information can be extracted from the series of observations or repeated experiments; this data is be used to select the most appropriate model.

2. Learning Objectives

To give a broad perspective on the subject and to work out the simplest examples.

3. Learning Outcomes

Students will master fundamental concepts of mathematical statistics, will be able to apply them to problems in mathematics, economics, physics, etc.

4. Course Plan

- Statistical models, samples, descriptive statistics. Empirical approach: empirical distribution and Glivenko – Cantelli theorem.
- Parametric statistics: estimations and their main properties. Unbiased estimators. Efficient estimators. Cramer – Rao low bound. Consistent estimators. Fisher – Neumann factorization theorem. Rao – Blackwell theorem. Confidence intervals.
- Statistical hypothesis testing. Common test statistics. Null hypothesis statistical significance testing. Neumann–Pearson lemma and the most powerful test at the given significance level.

5. Reading List

- a. Required

Hogg, R. V.

Introduction to mathematical statistics / R. V. Hogg, J. McKean, A. T. Craig. – 7th ed. – Edinburgh: Pearson, 2014. – 650 с. – На англ. яз. - ISBN 978-1-292-02499-8.

b. Optional

Newbold, P.

Statistics for business and economics / P. Newbold, W. L. Carlson, B. Thorne. – Upper
Saddle River: Pearson Education International, 2007. – 984 с. – На англ. яз. - ISBN 0-13-
814250-5.

6. Grading System

Final grade = 0.5(Homeworks)+0.5(Final Exam).

The final grade is rounded to the nearest integer; half-integers are rounded upwards.

7. Guidelines for Knowledge Assessment

1. Let $X_1, X_2, \dots, X_n \stackrel{iid}{\sim} \Gamma(\alpha, \beta)$. Find a pair of complete and sufficient statistics for this model.
2. Let X_1, X_2, \dots, X_n be a random sample from the Poisson distribution with parameter λ .
 - (a) Find the UMVUE for λ .
 - (b) Find the UMVUE for $\tau(\lambda) = e^{-\lambda}$. (Hint: Rao-Blackwell!)
3. Let X_1, X_2, \dots, X_n be a random sample Beta distribution with parameters $a = \theta$ and $b = 1$.
 - (a) Find the UMVUE for $1/\theta$.
 - (b) Find the UMVUE for $(\theta/(\theta + 1))^n$.

8. Methods of Instruction: lectures and tutorials conducted by course instructors

9. Special Equipment and Software Support (if required)

No requirements

Competences to be developed: UK-1, 2, 5, PK-1, OPK-1, 2 (according to *01.06.01 Mathematics and Mechanics* Educational Standard).
